

The AHCAUDIO IV26HR12 and IV26HR24 are vacuum fluorescent display clocks. There are three buttons on the back, one turns the display on and off, and the other two increase the hours and minutes respectively. Requires a 12V center positive 5.5x2.5 1.5A power supply.

The clock uses vacuum fluorescent display tubes made in the late 80s early 90s in former Soviet block countries. These came from Ukraine.

As lighting devices, these do not have an unlimited lifespan. In addition, these tubes were made at the end of Soviet manufacturing, and the quality is inconsistent at best. Some of these units have been in continual use for 3 years with no appreciable dimming, but they won't last forever, much like incandescent light bulbs, but with a much longer service life.

As long as replacements tubes are available, you can email me at jake@ahcaudio.com for replacement tube service.
